polylinker; Site 1: Not I; Site 2: Ecc RI; The
NIH BMAP Ret 4 S2 library is a subtracted library,
ultimately derived from mouse retina tissue library avarious stages of development. For a detailed description
of the library from which this clone was derived, please
visit our web site at brainest.eng.uiowa.edu. The tissue
for this library was contributed by Dr. Xin-Yuan Fu, Yale
University School of Medicine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enail: mESTGemail.nih.gov
Oligo-dr track not found, Not I site shown in beginning of sequence
is likely internal to the message. CDNA Library Preparation: M.B.
Soares Lab Clone distribution: Researchers may obtain BMAP CDNA
Glones from RESEARCH GENETICS. It should be noted that Bento Soares
is generating a small number of additional specialized
non-redundant arrays of BMAP CDNAs whose availability will be
considered under appropriate and limited collaborative arrangements
The tissue for this library was contributed by Dr. Xin-Yuan Fu,
Yale University School of Medicine The following repetitive
elements were found in this CDNA sequence: 1-31, >(CAG

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system-384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

polylinker; Site 1: Not I; Site 2: Eco Ri; The
NIH BMAP Ret4 52 library is a subtracted library,
ultimately derived from mouse retina tissue libraries at
various stages of development. For a detailed description
of the library from which this clone was derived, please
visit our web site at brainest.eng.uiowa.edu. The tissue
for this library was contributed by Dr. Xin-Yuan Fu, Yale
University School of Medicine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Email: mEST@mail.nih.gov
Oligo-dT track not found, Not I site shown in beginning of sequence
is likely internal to the message. CDNA Library Preparation: M.B.
Soares Lab Clone distribution: Researchers may obtain BMAP CDNA
clones from RESEARCH GENETICS. It should be noted that Bento Soares
is generating a small number of additional specialized
non-redundant arrays of BMAP CDNAs whose availability will be
considered under appropriate and limited collaborative arrangements
The following repetitive elements were found in this cDNA sequence:
1.31, > (CAG)n#Simple_repeat
POLYA-NO.

Genome. 12, 673-677 (2001)
Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)
RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)
Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)
cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             67 TCCTTGTTTGAAGCTTTGGGCTACGTGGATGACCAGCTGTTCGTGTTCTATGATCATGAG 126

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                   09981606-1A_COPY_67_339

The invention relates to a soluble polypeptide (I) of beta 2

microglobulin (beta2m)/HFE monochain comprising human beta2m (or its

analogue or active fragment). linked to alphal-alpha3 domains of human

CHEE (a central regulator of iron absorption; undefined), or its analogue

or active fragment, by a flexible linker peptide, or a functional

Gerivative or all of (I). (I) is useful for reducing intracellular iron

absorption in patients having hereditary hemochromatosis, transflusions,

thalassaemias, haemolytic anaemia or chronic infections, and for

delivering a therapeutic to ceals that over-express transferrin receptor

(TfR) which are preferably lymphocytes or leukocytes, across the blood-

brain barrier. (I) is further useful for treating brain tumour. (I)

is also useful for treating oxidative stress disorders resulting in

ctissue damage e.g. vascular diseases, inflammation, atherosclerosis,

lung injury, ischaemia, etc. A DNA molecule (II) encoding (I) is useful

ctissue damage e.g. vascular diseases, inflammation, atherosclerosis,

lung injury, ischaemia, etc. A DNA molecule (II) encoding (I) is useful

ctissue damage e.g. vascular diseases, inflammation, atherosclerosis,

ctissue damage e.g. vascular diseases, inflammation, the monochain manifests

specific characteristics advantageous for drug delivery systems. It is a

soluble, stable and fully conformed protein. It binds specifically to

transferrin receptor. It is continuously internalised by the target cells, thus

calls, minimising aide effects. It negatively regulates iron absorption,

cells, minimising aide effects. It negatively regulates iron absorption,

cells, minimising efficient drug delivery.

cells, minimising efficient drug delivery in the staget cells that over-express

tris not diluted in the blood as is transferrin. It should not induce an

immune response since it is a self non-polymeric protein and delivery of

changes wing monochain is expected to overcome drug-resistance since it is a

coding sequence of beta2m/HFE monochain 
                                                                                                                                                                                                                                                                      Soluble beta 2 microglobulin/HFE monochain useful for treating iron-overload conditions e.g. thalassemia and chronic infections, comprises human beta 2 microglobulin linked to alpha domains of HFE by

Hereditary haemochromatosis gene and variants - useful for diagnosis and treatment of hereditary haemochromatosis disease This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based cDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a Cys to Tyr substitution in the encoded protein (see AAW36499) at a Cys to Tyr substitution in the encoded protein (see AAW36499) at a Cys to Tyr substitution in the encoded protein (see AAW36499) at a Critical disulphide bridge important for secondary structure. The following are claimed: a 10825 bp genomic DNA sequence (1) (see AAT96690), the 1437 bp cDNA sequence (Ta) and their 24d1, 24d2 and 24d7 variants; a cloning or expression vector; host cells; a peptide product chosen from the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method mutation; an animal model for the HH disease; metal chelation Disclosure; Fig 4; 115pp; English.

                                                                                                                                                                                                                                                                                                                           9
agents, T-cell differentiation factors and therapeutic agents for the mitigation of injury due to oxidative process in vivo or mitigation of ino overload, a method for screening potential therapeutic agents for activity in connection with HH disease; an antisense oligonucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligonucleotides covering a range of nucleotides from (1), (1a) or their variants, useful for detecting a polymorphism in the HH gene. The invention also relates to methods for screening cor for HH homozygotes, to HH disease, including gene therapy, protein- and antibody-based therapeutics, and small molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ATGTGGCTGCAGCTGAGTTCAGAGTCTGAAAGGGTGGGATCACATGTTCACTTGACTTC

                                                                                                                                                                                                                                                                                                                                                                            09
                                                                                                           The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cDNA sequence encoding a histocompatibility iron loading (HFE) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                  288 cécrriécrecerricacacrerecacracerecreresagesecresages de cerrificario de contra de

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a human histocompatibility iron loading (HFE) protein. The HFE gene is a major histocompatibility (MHC) mon-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the aisorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number U60319). The presence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     127 GGTCTTTCCTTTGAAGCTTTGGGCTACGTGGATGACCAGCTGTTCGTGTTCTATGAT

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with hereditary haemochromatosis (HH) or a predisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample encompassing all or part of the DNA between markers D6S265 and D6S276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an autosomal recessive disorder (ARD) or predisposition to develop and/or genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous mutation in a gene, the normal function of which, is required to prevent progression of the disorder. The method(s) can be used to identify individuals that are homozygous or heterozygous (carriers) for the mutation causing the ARD.

CE precially the method is used to diagnose HH or predisposition to HH by detecting a Cys282Tyr substitution. Individuals homozygous for this mutation have HH and heterozygotes are potential carriers of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AIGIGGCIGCAGCIGAGICAGAGICIGAAAGGGIGGGAICACAIGIICACIGIIGACIIC 240

The present invention relates to human colon specific nucleic acids (ABV9310-ABV94009) and proteins (ABP68360-ABP6435). The nucleic acids and proteins are useful for treating colon cancer and colon disorders, and diagnosing or monitoring the presence of colon disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated colon-specific nucleic acid molecule, useful for treating colon cancer, and diagnosing or monitoring the presence of metastases
                                                                                                                                                                                              Human, colon, cytostatic, vaccine, gene therapy, colon cancer, colon disorder, metastasis, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

extending from D6S265, which is a marker that is centromeric of extending from D6S265, which is a marker that is centromeric of than, in a telemeric direction through D6S265, a marker at which the allelic association was no longer observed. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 66% of affected chromosomes and in 4% of unaffected chromosomes. It results in a Cys to Tyr substitution in the encoded protein (see AM36499) at a critical disulphide bridge important for secondary structure. The following are claimed: the HH genomic DNA (1), a 1437 bp cDNA sequence (Ia) (see AAT96691) and their 24d1, 24d2 and 24d7, variants; a cloning or expression vector; host cells; a 24d7 variants; a cloning or expression vector; host cells; a 24d7 variants; a cloning or expression of a least 56 amino acid residues of these; an antibody produced using the peptide; a method cesidues of these; an antibody produced using the peptide; a method cesidues of the pressness or absence of the common HH gene mutation; an animal model for the HH disease; metal chelation agents, T-cell differentiation factors and therapeutic agents for mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in conceining or creating a method for screening product of a nucleic acid sequence as above; and oligonucleotide directed against a transcriptional creating and therapeutic agents for relatively in connection with HH disease; an antisense oligonucleotide directed against a transcriptional creating and produced in the HH gene. The invariants, useful for detecting a polymorphism in the hypoxygores, to HH disease, including gene therapy, the hypoxygores, to HH disease, including gene therapy, the hypoxygores is and therapeutics, and small molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3762 GTTCACACTCTCTGCACTACCTCTTCATGGGTGCCTCAGAGCAGGACCTTGGTCTTTCCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This genomic DNA sequence corresponds to the human gene whose mutated form is associated with herediteary haemochromatosis (HH). To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ţ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3762 GTTCACACTCTCTGCACTACCTCTTCATGGCTGCCTCAGAGCAGGACCTTGGTCTTTCCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the human histocompatibility iron loading (HFE) gene. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the alsorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence is not a C to G denabank Accession number 1601191. The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Barton JC;

The present sequence represents a hereditary haemochromatosis subregion from an individual unaffected by hereditary haemochromatosis (HH). Also described is a method to determine the presence or absence of the common hereditary

```
haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual, and (b) assessing the
DNA or RNA for the presence or absence of a haplotype or genotype where
the presence or absence of the haplotype genotype indicates the likely
presence of the HFE gene mutation in the genome of the individual. The
products for use in the diagnosis and treatment of HFE. The present
invention also describes BTF genes, which are homologues of the milk
protein butyrophilin (BT), and can be used in the production of agonists
and arreagonists of BT function. Also described are: (1) a RoRet gene
which can be used to develop products for the study, diagnosis and
treatment of lupus and Sjogren's syndim transport gene, and can
which are homologues of a type I sodium transport gene, and can
similarly be used for hypophosphatemia.

products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an hereditary haemochromatosis (HFB) affected individual. ABO described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFB) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the by providing DNA or RNA for the presence or absence of the haplotype genotype indicates the likely presence of the HFB gene mutation in the genome of the individual. The products for use in the diagnosis and treatment of HFB. The present products for use in the diagnosis and treatment of HFB. The present products for use in the diagnosis and treatment of HFB. The present invention also describes BTF genes, which are homologues of the milk products for the study, diagnosis and antagonists of BT function. Also described are: (1) a ROREt gene which are homologues of a type I sodium transport gene, and can can milarly be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            43279
